## How it works

Flying cars use a range of technologies to utilize features like vertical takeoff and landing. These vehicles use propulsion systems & navigation technology in the air and on the ground.

- Propulsion Systems: A machine that produces thrust to push an object forward.
- Navigation Technology: These include GPS and Radar to navigate to the intended destination and to avoid other aircraft.

# History

The first prototype of a flying car was built in 1917 by Glenn Curtiss. The early model was called Autoplane. Throughout the 20th century, several inventors and companies attempted to create flying cars.

- Notable examples include the Waterman Aerobile in 1937, The Taylor Aerocar in 1949, and the Moulton Taylor Aerocar in 1956.
  - These early prototypes faced lots of technical challenges and none of them were available for commercial use.
- 
- 

## Plan & Implementation

- Accessibility: One use for flying cars is to increase the accessibility of getting to places with high mountain ranges and deserts. This is because you would not need to make it through or over and can instead fly above.
- Faster Emergency Response: Some people believe that flying cars would help to benefit the community by being able to travel fastly above high traffic areas as well as then landing virtually anywhere to pick up and save injured peoples lives faster.

Most experts estimate flying cars will begin entering the consumer market between 2025 and 2035. The most optimistic projections have them available as early as 2023, while the most conservative see general public adoption taking until the 2040s. Much will depend on the pace of regulatory approvals.

## Who or what will it impact

- A range of new jobs will be available from manufacturing and engineering to operations, maintenance, air traffic management and infrastructure development.
- The introduction of flying cars has the potential to revolutionize transportation. With faster travel times and reduced congestion, businesses will be able to operate more efficiently.
- Flying cars would also potentially reduce traffic on roads leading to a significant environmental impact. Giving flying cars electric or hybrid engines would reduce added emissions.

The development of flying cars is set to create a range of new jobs, from manufacturing and engineering to operations and maintenance. There will also be opportunities in related fields such as air traffic management and infrastructure development.

## Pros to the advancement

- Faster travel: with the ability to travel in a straight line, flying cars can cover longer distances quickly. This would be useful for people who travel for business and individuals that need to travel long distances in a short amount of time.
  - Reduced traffic: Flying cars can travel above roadways. This would eliminate stop lights, traffic jams, and other things that may slow down traditional vehicles. This would reduce travel times and overall improve traffic flow
  - Emergency response: flying cars would improve emergency response services. This would enable faster response times and more efficient transportation of patients to hospitals.
- 

Flying cars have the potential to revolutionize transportation in many ways, offering several advantages over traditional ground vehicles. Here are some potential benefits of flying cars: Reduced traffic congestion: Flying cars can travel above roadways, eliminating the need for stoplights, traffic jams, and other ground obstacles that slow down traditional vehicles. This could significantly reduce travel times and improve overall traffic flow. Faster travel: With the ability to travel in a straight line, flying cars can cover long distances quickly and efficiently. This could be particularly useful for business travelers and individuals needing to travel long distances in a short amount of time. Emergency response: Flying cars could be a game-changer for emergency response services, enabling faster response times and more efficient transportation of patients to hospitals in emergency situations. While there are many potential benefits to flying cars, there are also concerns surrounding their widespread adoption. The next section will delve into some of the challenges and concerns associated with this new mode of transportation.

## Cons to the advancement

These challenges could be classified into three categories: air traffic management, infrastructure requirements, and regulatory hurdles

- Adding Flying cars into existing airspace could cause lots of issues for Air traffic management systems, which would need to be updated to accommodate the new vehicles.
- Flying cars would require specialized infrastructure, including takeoff and landing zones and charging stations. In urban areas this may require the construction of new buildings or changing existing ones.
- Regulatory bodies will need to establish new rules and guidelines to govern the operation of flying cars. Like licensing requirements for pilots and operators, minimum safety standards and liability issues would need to be addressed before any flying cars could be introduced into societies.

Regulations for flying cars are still in the early stages of development. At the federal level, the Federal Aviation Administration (FAA) is responsible for regulating airspace and aviation safety. However, flying cars present unique challenges that will require new regulations and guidelines. States and cities will also need to address the regulatory challenges posed by flying cars. For example, how will they integrate with existing transportation infrastructure, such as airports and highways? Will new laws be needed to address issues such as noise pollution and airspace restrictions?

## Summary

In Summary there are some important pro's including faster emergency response time which could save many lives. As well as opening up new jobs such as manufacturing and engineering.

- However there are also a few things that would make this invention challenging to make readily available. Such as air management issues.
- As far as economic impact it is both positive and negative. Positives being that the needs for roads would decrease giving animals more space in their natural habitats. Negatives are that places on high mountains or more remote areas would now become available decreasing certain habitats.

## How We feel

Ashlyn - I personally think that with how society is today flying cars would cause more problems than they would solve. I think it would cause more pollution to create the cars and take much more money than it saves. I also think that they could be incredibly helpful if we were able to find the correct way to introduce them into society.

Kaia - I think that overall flying cars would not be helpful for the general public because it would cause increased air traffic management issues. These would also be expensive and add to pollution. And in my opinion for the aside from medical uses I do not think this will add anything
